

ABSTRACT

A platen on which a recording medium advances, of an inkjet recording apparatus, having:

a grooved section formed in a direction perpendicular to a feeding direction of the recording medium on the platen, to receive oversprayed ink jetted onto the recording medium from a recording head; and

a supporting member which moves up to a supporting position and supports the recording medium when the recording medium crosses over the grooved section, wherein the supporting member prevents the recording medium from falling into the grooved section and maintains a stable distance between the recording medium and the recording head.
